

## Assignment: Windows Server – Shared Folder and NTFS Permissions

### 1. Create a Shared Folder Named "MusicLibrary"

#### Steps:

1. Create a folder named **MusicLibrary**.

Example: C:\MusicLibrary

2. Right-click the **MusicLibrary** folder and select **Properties**.
3. Open the **Sharing** tab.
4. Click **Advanced Sharing**.
5. Check **Share this folder**.
6. Set the Share Name as **MusicLibrary**.
7. Click **Permissions**.
8. Remove the **Everyone** group.
9. Click **Add** and select the **Students** group.
10. Allow only the **Read** permission.
11. Click **Apply** and then click **OK**.

#### Result:

The **MusicLibrary** folder is successfully shared, and only members of the **Students** group have **Read** access through the network share.

---

### 2. Configure NTFS Permissions on "MusicLibrary"

#### Steps:

1. Right-click the **MusicLibrary** folder and select **Properties**.
2. Open the **Security** tab.
3. Click **Advanced**.
4. Click **Add** and select the **Students** group.
5. Allow the following permissions:

- Read & Execute
  - List Folder Contents
  - Read
  - Write
6. Click **Show Advanced Permissions**.
  7. Locate the **Delete** permission and select **Deny**.
  8. Click **Apply** and then click **OK**.

**Result:**

Members of the **Students** group can read, create, and edit files in the **MusicLibrary** folder, but they cannot delete files because the **Delete** permission is explicitly denied through NTFS permissions.

---

### **3. Map the Shared Folder and Test Permissions**

**Steps:**

1. On the Windows client computer, open **File Explorer**.
2. Click **This PC → Map Network Drive**.
3. Choose a drive letter, for example **Z:**.
4. Enter the shared folder path:

\\ServerName\MusicLibrary

or

\\192.168.1.10\MusicLibrary

Replace the server name or IP address with the actual server details.

5. Click **Finish**.
6. Perform the following permission tests:
  - Copy a file into the shared folder.
  - Edit the copied file.
  - Try to delete the file.

### Observation:

| Action        | Result     | Reason                                                           |
|---------------|------------|------------------------------------------------------------------|
| Copy a file   | Successful | NTFS Write permission allows creating files.                     |
| Edit a file   | Successful | NTFS Write permission allows modifying file contents.            |
| Delete a file | Failed     | Delete permission is explicitly denied through NTFS permissions. |

### Explanation:

The **Students** group has permission to create and edit files, but the **Delete** permission is explicitly denied through NTFS permissions. Therefore, users can save and modify files but cannot remove them from the shared folder.

### Result:

The shared folder was successfully mapped to the client computer, and the configured Share and NTFS permissions were successfully tested.

---

## 4. Create a Second Shared Folder Named "PhotoShare"

### Steps:

1. Create a folder named **PhotoShare**.

Example: C:\PhotoShare

2. Right-click the **PhotoShare** folder and select **Properties**.
3. Open the **Sharing** tab.
4. Click **Advanced Sharing**.
5. Check **Share this folder**.
6. Set the Share Name as **PhotoShare**.
7. Click **Permissions**.
8. Remove the **Everyone** group.
9. Click **Add** and add your user account.
10. Grant **Full Control** permission.

11. Click **Apply** and then click **OK**.
  12. Open the **Security** tab.
  13. Remove unnecessary users or groups if required.
  14. Add your user account.
  15. Grant **Full Control** permission.
  16. Click **Apply** and then click **OK**.
- 

## Testing PhotoShare

### Steps:

1. Log in using another user account.
2. Open File Explorer.
3. Try to access the shared folder using:

\\ServerName\PhotoShare

4. Observe the result.

### Result:

The second user cannot access the **PhotoShare** folder and receives an **Access Denied** message because only the specified user account has been granted **Share and NTFS Full Control** permissions.
